The screenshot shows the SharpPad code editor interface. The title bar reads "[metadata] Int32.cs — HelloCS". The left sidebar has sections for EXPLORER, OPEN EDITORS (Program.cs, [metadata] Int32.cs), HELLOCS (.vscode, bin, obj, HelloCS.csproj), OUTLINE, and ILSPY DECOMPILED MEMBERS. The main editor area displays the following C# code:

```
//  
// Summary:  
//     Converts the string representation of a number to its 32-bit signed integer.  
//  
// Parameters:  
//     s:  
//         A string containing a number to convert.  
//  
// Returns:  
//     A 32-bit signed integer equivalent to the number contained in s.  
//  
// Exceptions:  
//     T:System.ArgumentNullException:  
//         s is null.  
//  
//     T:System.FormatException:  
//         s is not in the correct format.  
//  
//     T:System.OverflowException:  
//         s represents a number less than System.Int32.MinValue or greater than System.Int32.MaxValue.  
[NullableContextAttribute(1)]  
public static Int32 Parse(string s);
```

The status bar at the bottom shows Ln 13, Col 26, Spaces: 2, C#, SharpPad:5255.

This piece of code is called ValueConverter A value converter is a class, that implements the simple interface `IValueConverter` with the two methods `object Convert(object value)` and `object ConvertBack(object value)`.

Then you can reference it by using `Simplify` the usage of `ValueConversIf` you want to use a normal `ValueConverter` in XAML, you have to add an instance of it to the resources and reference it by using a key.

Now I wish to pass current row object (which sits in `DataGrid CurrentItem`) to command execution logic.. Then you can create an instance of a value converter in the resources of the view and give it a name.. Cast your parameter to your model inside your commandns Execute method Say for example that you wanted to prevent the command from executing if the `SelectedItem` was null or if the Item has to be selected, then all you need is to return a bool from your `CanExecute` method based on whatever you want.. Wpf converter command parameterGet via App Store Read this post in our app!how to pass an integer as `ConverterParameter`?I am trying to bind to an integer property:and my converter is:the problem is that when my converter is called the parameter is string. ## Color Laserjet 2600 Driver For Mac

A simple and cool trick is to derive value converters from MarkupExtension. This way you can create and use it in the binding like this: `Text=>`, and that is quite cool! Wpf converter command parameterGet via App Store Read this post in our app! How to convert command parameter just before command is executed? I have a DataGrid in my view and DataGrid has cells with buttons, which have commands assigned.. This is cumbersome, because the key is typically just the name of the converter.. Can I somehow avoid bringing DataGrid reference into my command execution logic, like defer CommandParameter resolution until Command is performed or something like that? Update: I need CurrentItem and CurrentColumn, I've realized, that CurrentItem might be accessible through binding of SelectedItem, so to avoid receiving answers with proposing use SelectedItem property.. That's all you need to do How to use a ValueConverter in XAMLFirst thing you need to do is to map the namespace of your converter to a XAML namespace..

My initial idea was to use CommandParameter with value converter, where converter would take DataGrid as parameter and extract required information from DataGrid into my own class - in such way I would avoid reference to DataGrid from my view
```

---

model.. Your command Parameter should be just CommandParameter="" that way the parameter will be the row DataContext where the button was clicked which is an instance your model.. This is a common naming for value converters Make it public and implement the IValueConverter interface.. Problem is, that CommandParameter binding/value conversion is executed when grid is shown, meaning that there is no selected item yet.. So my initial idea was close enough When I was binding CommandParameter to DataGrid, problem was, that when binding was resolving, DataGrid didn't knew yet what is CurrentColumn or CurrentCell or CurrentItem, so it was resolving to empty values. cea114251b [Napoleonic Era 2.1.7b Available For Mac](#)
